

**EXHIBIT 3**

<b>Reissue Application</b>	<b>U.S. Patent No. 5,761,621</b>
<p>44. A wireless communication system organized to promote user driven competition among a plurality of commercially independent wireless service providers, comprising</p> <p>a. a plurality of independent wireless service networks operated by the wireless service providers to provide wireless services within a common geographic region using differing frequencies and/or differing protocols</p> <p>b. a plurality of portable radio devices, located within the geographic region, that are sufficiently frequency and protocol agile to allow access to more than one of the wireless service networks. each said portable radio device including</p>	<p>23. A radio frequency management system for providing information useful in selecting among a plurality of wireless communication networks having different and variable operating characteristics and accessed by a plurality of portable radio devices each of which is capable of accessing any of the plurality of wireless communication networks comprising:</p>

	<p>wireless communication network monitoring means for monitoring the current network load of each of the plurality of wireless communication networks;</p> <p>processing means connected with said network monitoring means for receiving a signal indicative of said current network load and for generating a signal representing current operational characteristics of each of the wireless communications networks in response thereto;</p>
<p>i. an accessing circuit for providing access to any one of a plurality of the wireless service networks by requesting access and, if available, establishing access in response to an access control signal that adjusts the radio frequency and the protocol of the associated portable radio device as necessary to access the selected wireless service network</p>	
<p>iii. control signal generator for automatically generating the access control signal in response to an automated selection of the wireless network that best satisfies the stored criteria for wireless service and for</p>	

causing said accessing circuit to access the wireless service network identified by the access control signal generated.	
ii. memory for storing a user criteria for selecting a wireless service and	
	network information transmission means connected with said processing means for receiving said signal and for transmitting said operational characteristics for each of the plurality of wireless communication networks to each of the plurality of portable radio devices thereby allowing each of the portable wireless devices to selectively access one of said plurality of wireless communications networks in response to said operational characteristics.
